AI Work Allocation & Review Tracker

Know who is doing what, where it stands, and whether it is reviewed

Built with Claude and Google AI Studio

Before: nobody could answer these quickly

Who is working on what?

Has it been reviewed?

What is overdue?

The goal: one place to see all work, who it is allocated to, its status, and whether it is reviewed and completed.

Meet the team behind the app

Claude

The builder. Designed the system and wrote the code with me.

Google AI Studio

The brain. A Gemini key lets the app understand typed instructions.

Streamlit

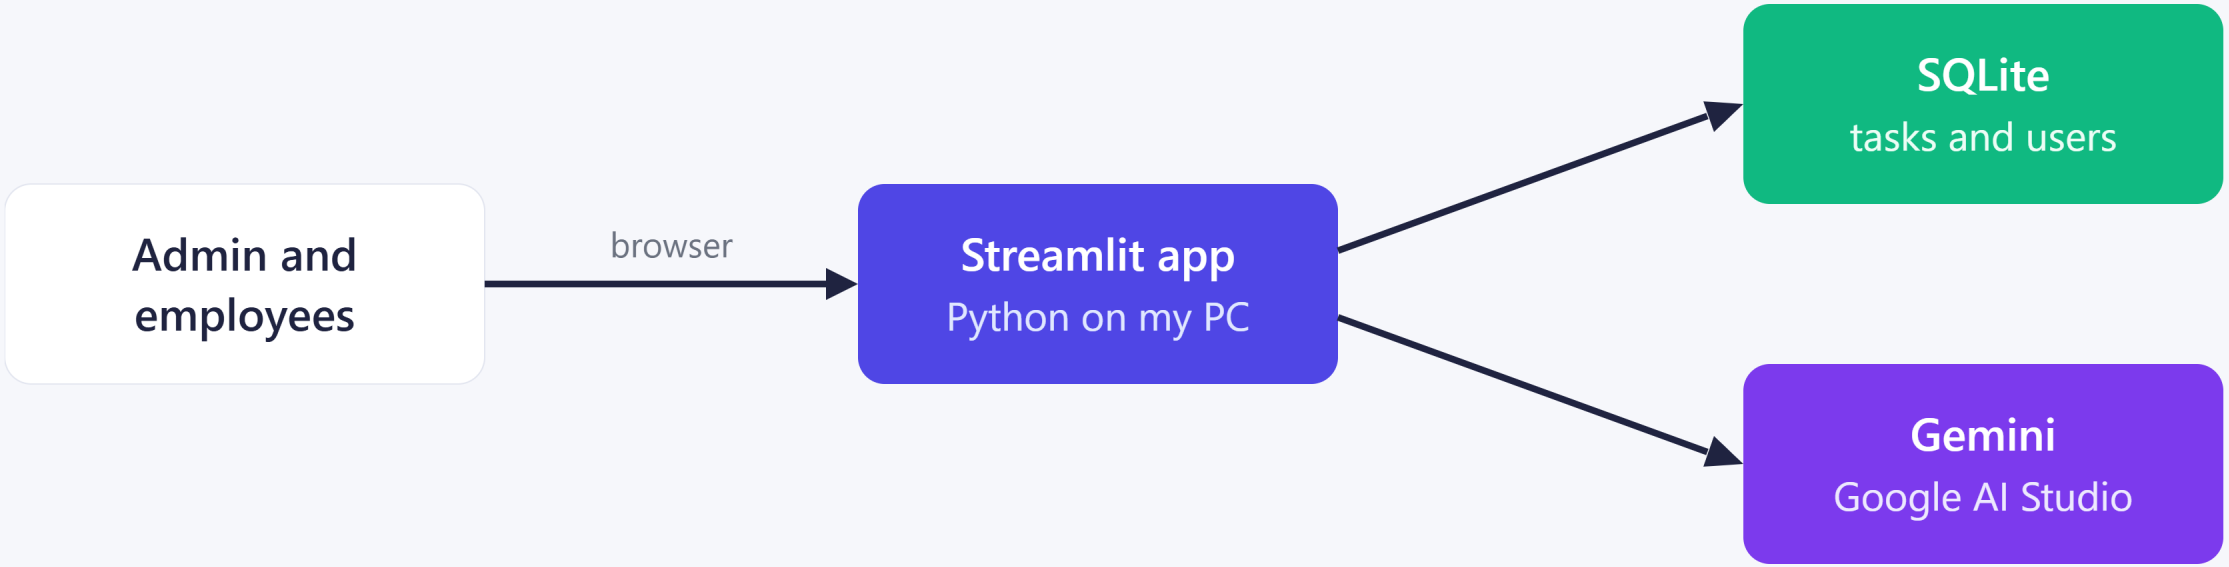

The face. Turns Python into screens you open in a browser.

SQLite

The memory. One local file stores every user and task.

Language: Python. Runs on my computer, no cloud needed.

How the pieces connect

Everyone uses a browser. The app checks who they are, reads and saves tasks in SQLite, and calls Gemini only for the AI features.

How I built it

1. Defined the need
2. Chose a local stack
3. Claude built the core
4. Connected Gemini
5. Tested and restyled

The core: database, login with roles, dashboard, task form and review queue.

Problems I hit, and how I fixed them

Key not found

Added a box to paste the key inside the app.

Model retired (404)

Switched the model name and added a model chooser.

Timeout (504)

Added retries and a longer wait.

Icons overlapped

Fixed the font so icons draw properly.

How a task moves

Admin creates and assigns → **Employee updates status** → **Submitted for review** → **Admin approves or sends back** → **Completed**

Status dots in every table: Not Started · In Progress · In Review · Rework · Completed

AI in action

You type

Ravi to reconcile HDFC bank for October by Friday, high priority

→

The app creates

Task: Reconcile HDFC bank, October
Assigned to: Ravi
Priority: High
Due: Friday, as a real date

Also: a plain-English weekly summary of what is done, pending and overdue.

What each person can do

Admin

- Dashboard: totals, overdue, pending review
- Create, reassign, edit, delete tasks
- Review queue with comments
- Team accounts and passwords
- Excel export and AI task entry

Employee

- Sees only their own tasks
- Updates status and adds remarks
- Attaches files for review
- Changes own password
- Cannot see anyone else's work

Results, limits and next steps

Results

A working app with roles, a review flow, a dashboard and AI task entry.

Limits

Runs on one computer that must stay on. AI features need internet.

Next steps

Online hosting, email reminders and recurring tasks.

Thank you. Questions?
